

# Team Contract

---

**Group Number:** 008

**Group Member Names:** Ty Wagner, Vladimir Grinfelds-Ventura, Tai Shishiba

**Group Target Grade:** What grade is the group aiming for on the projects?

50-59%

60-69%

70-79%

80-89%

90-100%

***Is that a consensus?*** If members are aiming at different grades, work it out now and record what you agreed: what standard of work you will hold each other to, and roughly how many hours each member expects to put in per week. Groups run into trouble far more often over unequal effort than over different ambitions. **We agree to...**

review all code by other members before being merged to ensure code quality stays consistent. Each member will contribute about (5?) hours per week of total work. This can include code, code reviews, documentation, testing, or any other work needing to be done.

---

***Rules for Participation:*** Team members need to contribute fully to the best of their ability. Members need to take initiative in participating in the group tasks, especially in areas where they may have strengths. Those with greater ability may also need to help those who may be struggling by guiding, coaching or critiquing. Those who may be struggling should be clear when they need clarification or assistance. To make teams work well, members need to make concerted efforts to be available for meetings. Wanting the group to succeed will contribute to success – begrudging contributions will erode success. **We agree to....**

break up work into equal chunks, where team members ideally allocate an equal amount of work into the group tasks. Those who may be struggling to keep up with the workload can request for help or have some tasks delegated after a civil discussion between group members to reach a reasonable consensus as to how to distribute responsibilities .

---

***Communication and Conduct:*** For effective teamwork to occur there needs to be a free, open and appropriate expression of ideas and feelings at all times. Each member actively listens to other members, and after listening, provides effective non-judgmental feedback. Members take responsibility to communicate their ideas, thoughts, concerns, etc. Respectful communication (verbal and non-verbal) in response to cultural and personal differences contributes to team cohesion. **We agree to...**

communicate in a civilized manner, promising to offer constructive criticism while also being open to others ideas and feelings - making our group meetings a safe space for these discussions to take place. These will include things like disagreements in decisions, conflicts in beliefs, etc. (including non-technical topics).

---

**Organization and Meetings:** *An effective team needs to be organized. Members determine how the team is organized. This in turn, contributes to a member understanding their responsibilities, ensuring things are getting done and that there is no repetition in completing tasks. We agree to....*

have/attend regular meetings, at least once a week, while having regular discussions over messaging apps. Messages regarding group project details should be responded to in a timely manner; within 36 hours ideally. Tasks will be listed in a Linear board, where members can claim and update the status on any task they have been assigned/have chosen. This way, no member will accidentally work on the same thing at the same time. At a more higher level, we will discuss beforehand during team meetings/chats about who will do what, with more details able to be discussed as the time to implement takes place.

---

**Code Sharing and Version Control:** *A team needs one agreed place where the project code lives, and one agreed way of getting changes into it. Passing files by email or messaging app works until the week it does not, and a team that discovers on the last evening that two members have been editing different copies loses work it cannot recover. A version control system solves this, and a guide to using Git for this course is posted on D2L. Beyond keeping the code safe, a repository is a record of who contributed what and when. Teams are not required to use Git, but a team that uses it has evidence of its own work, which is useful to the team and to the instructor if questions arise later. Where the code will live (repository URL, if using Git). Who set it up, and confirmation that every member has access. How often members will commit and push their work. We agree to...*

**Github:** <https://github.com/bruhCoVr/mysh>

Vladimir has set up the github repository, and we have all confirmed access to it.

We agree to push work on a regular basis, where pull requests will consist of many smaller chunks of a larger feature branch, which will then be pulled into the main branch.

The syntax will look something like:

```
feat/ls-command
```

---

**Contribution History:** *The group grants the instructor access to the repository when it is created. If the group is not using Git, the group keeps a record of contributions in a Google document shared with the instructor. The record of contributions must briefly describe the changes made and identify the team members contributing to the changes. The records must be updated on the day the work is done. We agree to...*

use GitHub for all record of group contributions. The commit messages will briefly describe the changes made in that commit, with additional information in the pull request if required. Code will be pushed often to ensure other group members and the instructor have the most updated version of the project as possible.

---

**Assessment and Conflict Resolution:** *A well running team is always interested in how things are going and is willing to make changes when something is not working. Members of an effective team will contribute to an attitude of action and momentum. Often, progress is a good indicator of how well the team is working together. Regular assessment is necessary for a team to ensure it is continuing to work well together. Most often what needs attention is that a member has fallen behind, and the cause is rarely bad faith. Silence is the real difficulty rather than the delay. Agree on how you will check in on how the group is doing and how often, and on what you will do if a member falls behind: how soon they are expected to say so, how you will help, and at what point you will raise it with the instructor.*

*We agree to...*

weekly group check-ins to ensure everyone is kept up to date with their schedules so task delegation can be performed appropriately. If a team member falls behind we will check on them through a private, one-on-one conversation to understand what is causing the issue(s) and proceed from there. This is expected to be resolved quickly after the problem becomes apparent (within a day or two) so at least the other team members can pick up some additional work if required. The issue will be taken up with the professor after 1 week of no communication or resolution of the issue.
